Patient: BANAT, MOHAMMAD (M)

Exam Date: 11/26/2012

MRN : MOHAMMAD

DOB: 01/27/1978

Referring Physician: SECOND OPINION, XMRI

FAX: 888-886-2486

MR OF THE BRAIN WITHOUT CONTRAST

EXAM: MRI OF THE BRAIN.

HISTORY: BRAIN TUMOR, GRADE II.

COMPARISON: 8/25/12.

TECHNIQUE: MRI of the brain was performed utilizing sagittal T1, axial T2, diffusion, and axial and coronal FLAIR sequences as well as axial and coronal T1 weighted sequences post contrast.

FINDINGS:

The ventricles, basal cisterns, and sulcal pattern are normal for the patients stated age. The third and fourth ventricles are in a normal midline position. There is a 3.8 x 2.3 x 2.1 cm CSF lesion in the left temporal lobe with surrounding medial temporal gliosis without interval change in appearance from the prior exam. This is likely secondary to the patient stated neoplasm and post surgical changes/encephalomalacia. No enhancing abnormalities are seen. No other interval abnormal areas of increased or decreased signal intensity or extra axial fluid collections are seen. The brainstem and posterior fossa are normal. Normal flow voids are seen. No sella or parasellar abnormalities are seen. The 7th and 8th nerve complexes, as well as 5th nerves, are symmetric and appear unremarkable

There is a right maxillary retention cyst/polyp. The visualized orbits, paranasal sinuses, and mastoid complexes are unremarkable.

IMPRESSION:

Stable MRI of the brain with contrast. No interval change or enhancing lesions are seen. Continued surveillance is recommended.

Note: The above report was provided by the signing radiologist at the request of the referring physician, patient or patient representative as a second opinion consultation.
